# **DNS**

is the phonebook  
of the Internet  
and

# **DNSSEC**

is unspoofable  
caller ID

## **DNS**

pairs user friendly  
labels to Internet  
network addresses

## **DNSSEC**

ensures accuracy  
of that information

## BENEFITS OF DNSSEC

- ◎ Protects users
  - ◎ Strengthens trust in the Internet
  - ◎ New possibilities
- 

## Concluding for Businesses

- ◎ Mitigate risk of cyber crime
- ◎ Protect business and brand image
- ◎ Build reputation as prioritizing security and protecting customers

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The diagram is partially cut off by the left edge of the slide.

# **The Problem with DNS**

What's the big deal?

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of interconnected nodes and lines, with nodes represented by circles of varying sizes. The diagram is partially cut off by the bottom and right edges of the slide.

DNS data can be disrupted  
and fake data inserted

DNS data can be disrupted  
and fake data inserted

DNS data can be disrupted  
and fake data inserted

## RISKS

An attackers can:

- ◎ Steal passwords/credentials, credit card info, identity, etc (a.k.a phishing)
- ◎ Bypass anti-spam protection
- ◎ Disseminate misinformation
- ◎ Redirect (wiretap) on phone calls (VoIP)
- ◎ Spread malicious software

## DNSSEC

- ◎ Ensures credibility of DNS information.
  - ◎ Protects against data spoofing and corruption.
  - ◎ Adds security, while maintaining backwards compatibility.
- 

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The overall structure is organic and sprawling, resembling a molecular or biological network.

# How does all this work?

DNS Basics

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of interconnected nodes and lines, with nodes represented by circles of different sizes and some having concentric rings. The lines are thin and grey, creating a complex, web-like pattern.

## TERMINOLOGY

**IP Address** is a unique identifying string of numbers given to every device on the Internet.

IPv4: 93.184.216.34

IPv6: 2606:2800:220:1:248:1893:25c8:1946

## TERMINOLOGY

**Domain Name** identifies an entity on the Internet by a human readable alphanumeric name.

FQDN: `www.example.org`

## Terminology

**DNS (Domain Name System)** is the mediator between the IP addresses and domain names.

FQDN: `www.example.org`

to

IPv4: `93.184.216.34`

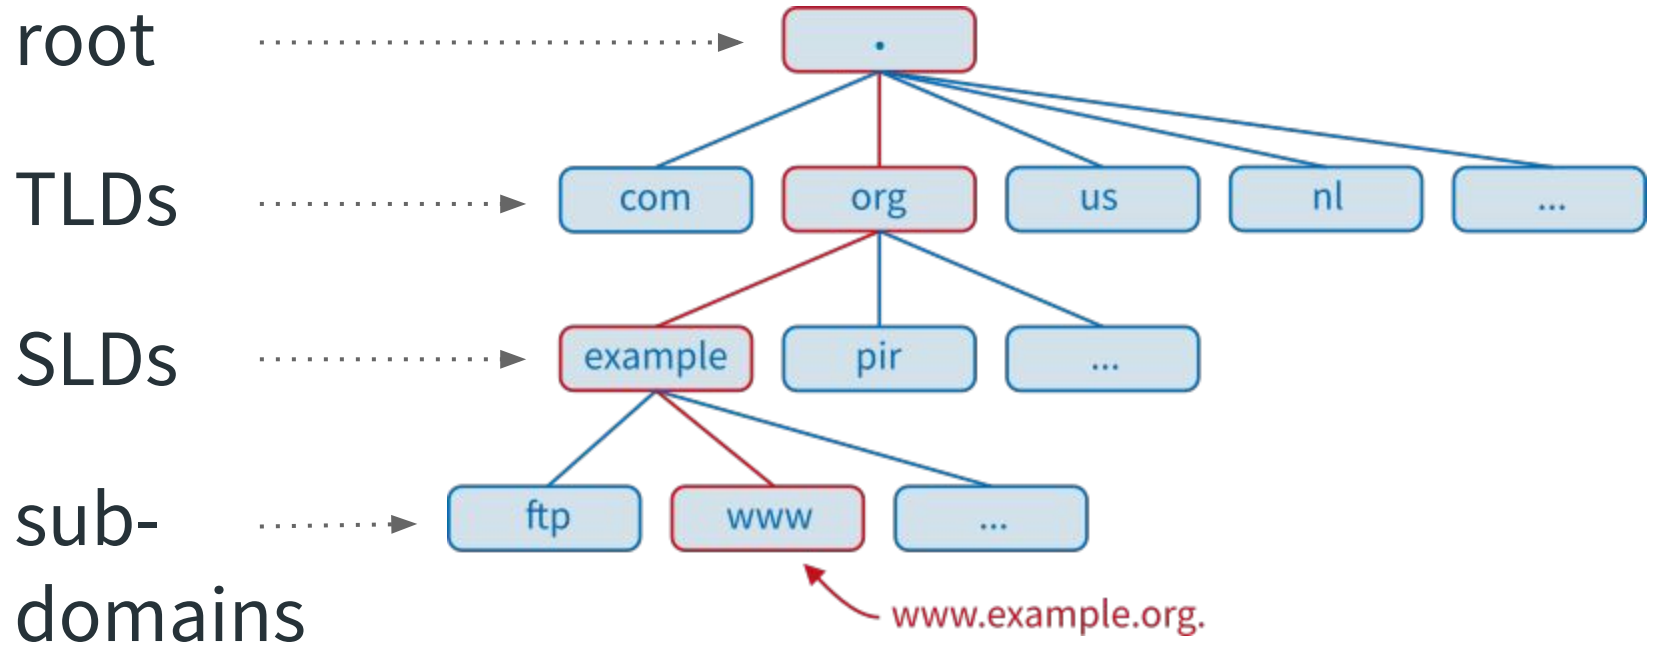

IPv6: `2606:2800:220:1:248:1893:25c8:1946`

## Anatomy of a Domain Name

# DNS HIERARCHY

## Terminology

**Zones** are delegated subsets of the hierarchical DNS structure

**Resource Records (RR)** are the data in zones, such the mappings between domain names and IP addresses.

## RESOURCE RECORDS (RR) EXAMPLES

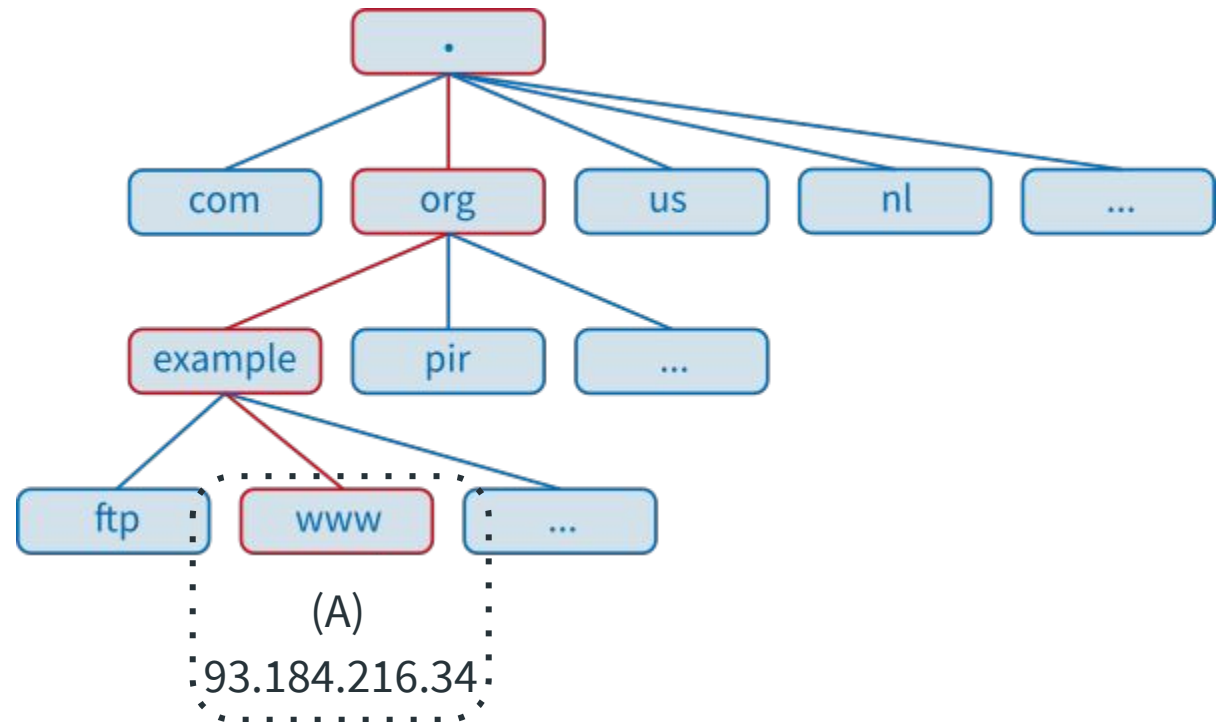

**A/AAAA** - A Host Address IPv4/IPv6

**NS** - Authoritative Name Server

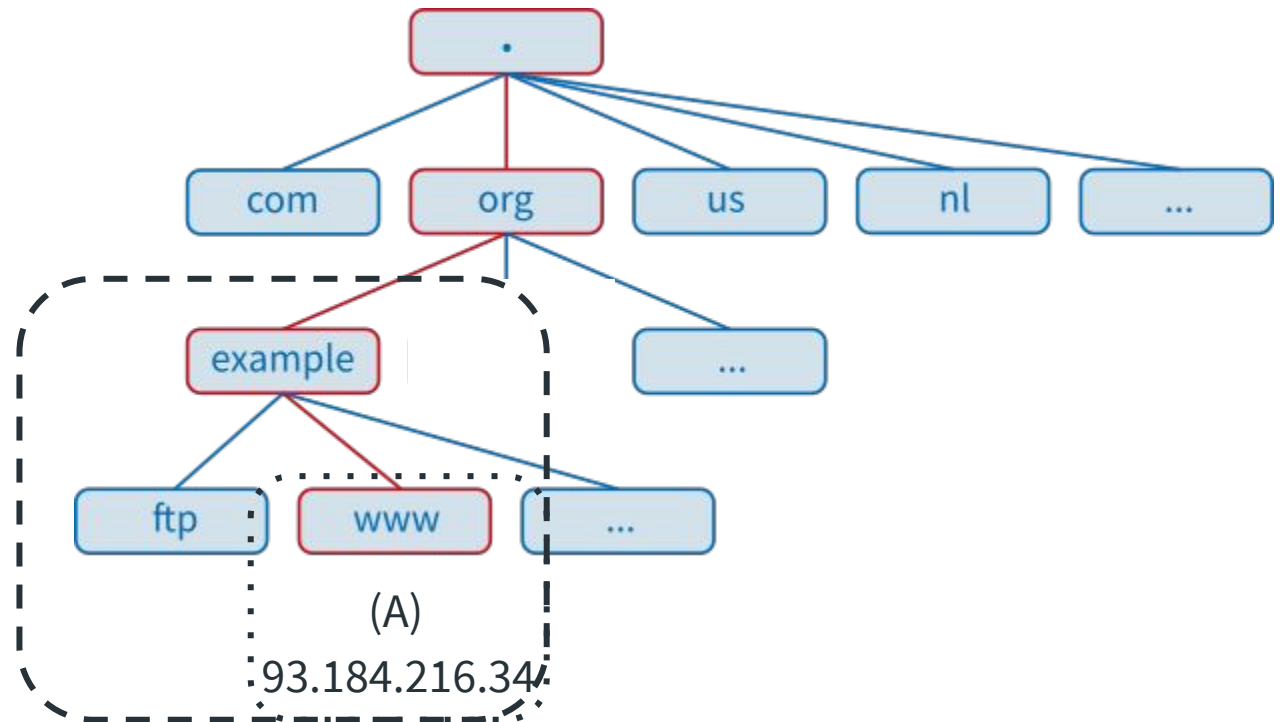

**MX** - Mail Exchange

## DNS RESOURCE RECORD - WWW

## DNS ZONE - EXAMPLE.ORG.

## Terminology

A **Nameserver (NS)** maintains a directory of domain names to their IP addresses.

Nameservers are  
The Internet's “phone books”

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The diagram is partially cut off by the left edge of the frame.

# Using the Phone Book

How DNS translates

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of interconnected nodes and lines, with nodes represented by circles of varying sizes and some having concentric rings. The lines are thin and grey. The diagram is partially cut off by the bottom and right edges of the frame.

# DNS Lookup

How does my computer find  
`www.example.com`?

# DNS Lookup

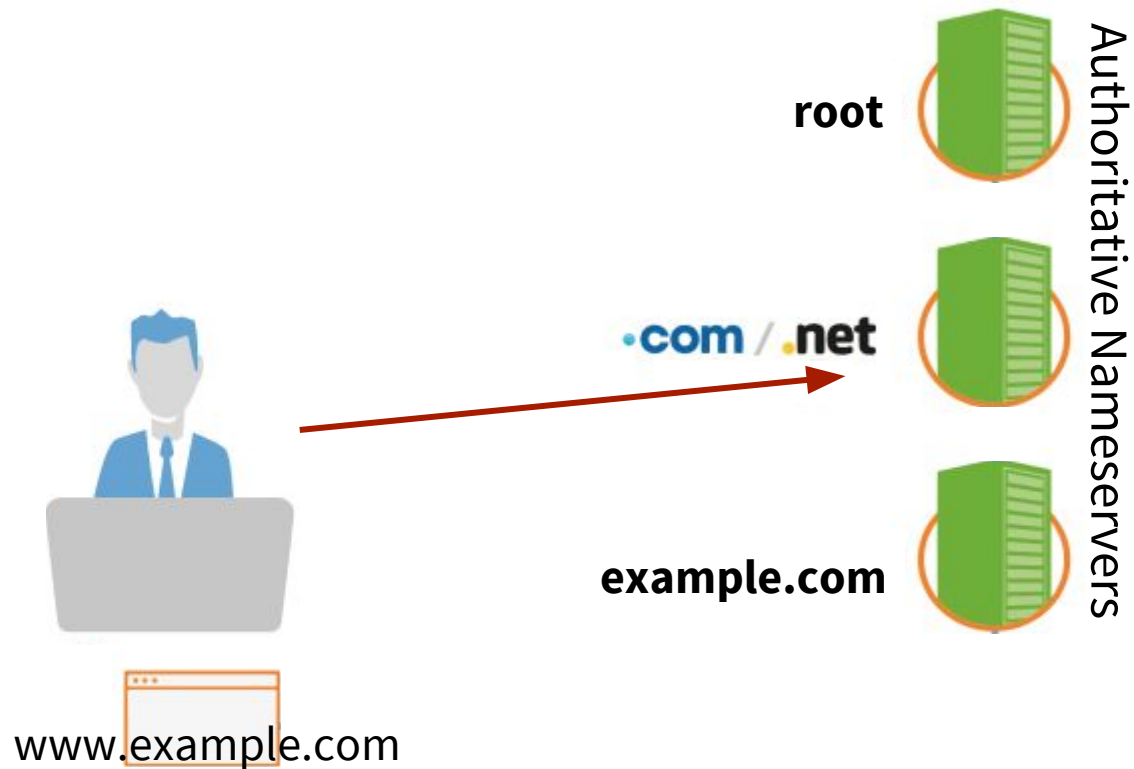

Where is `www.example.com`?

# DNS Lookup

Go ask .com's  
nameserver (NS)

# DNS Lookup

Where is `www.example.com`?

# DNS Lookup

Go ask example.com's  
nameserver (NS)

# DNS Lookup

Where is `www.example.com`?

# DNS Lookup

`www.example.com` is at  
93.184.216.34 (A)

# Site Found

Communicate with  
[www.example.com](http://www.example.com)!

# Exploits

DNS Hijacking,  
Spoofing, and  
Cache Poisoning

- ◎ Kaminsky Bug
- ◎ Rogue DNS Servers
- ◎ MITM

- ◎ Direct Manipulation  
(State, ISP, etc)
- ◎ Route Hijacking

# DNS Poisoning

Flood with fake answers

## DNS EXPLOITED

2007 - 2011 - DNSChanger/RSPlug

2011 - Brazilian ISPs fall victim DNS cache poisoning

2014 - Turkey intercepts Google's public DNS service

A decorative network diagram in the top-left corner, consisting of a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The diagram is partially cut off by the left edge of the slide.

# **SSL/TLS**

# **Can't Save You**

And the CA problem

## SSL/TLS

SSL (Secure Sockets Layer) establishes an encrypted connection between a web server and a browser.

SSL/TLS matches the the certificate to the DNS name, not if you've been sent to the correct site.

## SSL/TLS CERTIFICATE AUTHORITIES

SSL/TLS uses certificates obtained from a 3rd party called a CA (Certificate Authority).

- ◎ Too many CAs
- ◎ A CA can delegate trust subordinate certifications authorities
- ◎ Any CA can issue certificates for any entity on the Internet

## WHEN SSL/TLS FAILS

- ◎ Comodo and DigiNotar compromise results in issuing of fraudulent certificates
- ◎ Symantec issued rogue Google certificates
- ◎ Microsoft, Dell, and D-Link leaked private keys

**We need to  
secure  
DNS for a  
secure  
Internet.**

# DNSSEC

Tamper-proof DNS

Domain Name System Security  
Extensions

## DNSSEC

- ◎ Protects users
  - ◎ Strengthens trust in the Internet
  - ◎ Backwards compatible
- 

## DNSSEC

### **DNSSEC Authenticates**

1. DNS data originated from a legitimate sender
2. Data was not tampered in transit
3. Nonexistent data does not exist

# Chain of Trust

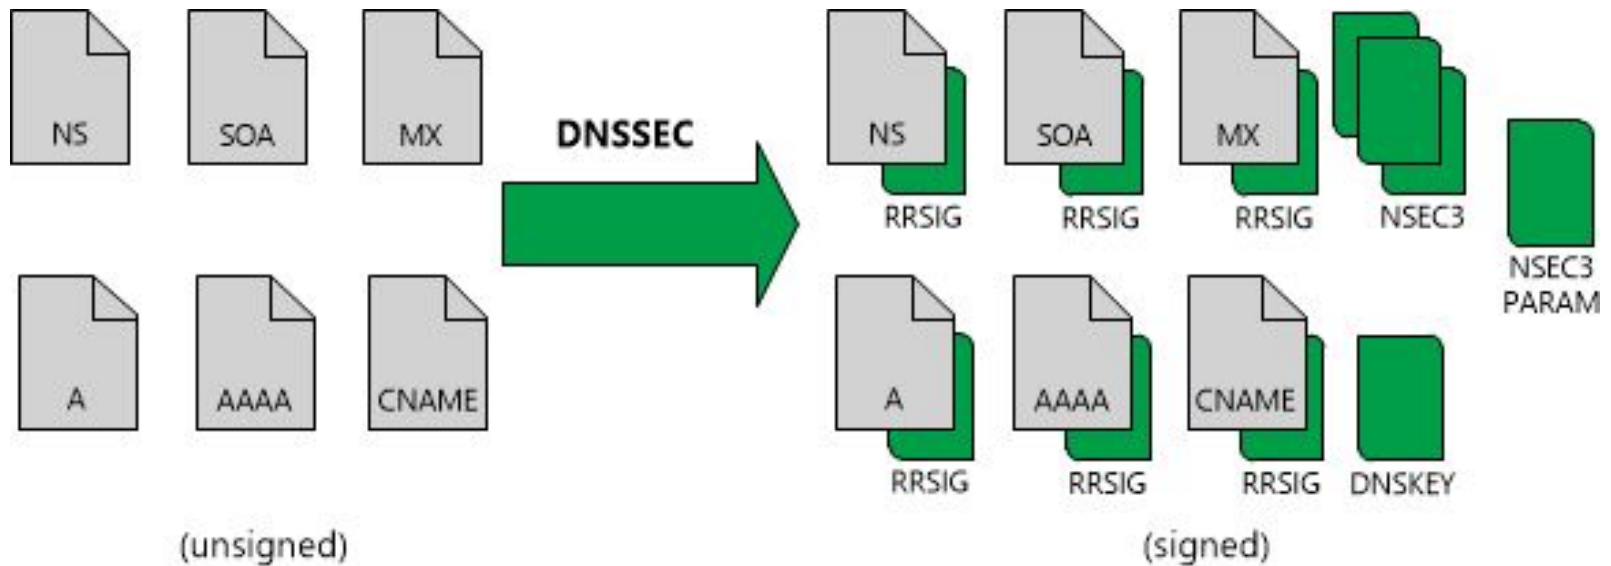

DNSSEC IS NOT

**DNSSEC does not:**

- ◎ Provide confidentiality
  - ◎ Guarantee availability
  - ◎ Protect against compromised nameservers
- 

# Signed Zone

RRSIG contains the cryptographic signature of the data.

# DNSSEC Lookup

`www.example.com` is at  
93.184.216.34 (A) + Signature of A (RRSIG)

## DNSSEC RESOURCE RECORDS

- ◎ **DNSKEY**  
DNS Public Key
  - ◎ **RRSIG**  
Resource Record Signature
  - ◎ **DS**  
Delegation Signer
- 

# DNSSEC Validation

What is the public key for  
example.com?

# DNSSEC Validation

example.com's public key  
(DNSKEY)

# DNSSEC Validation

Signature (RRSIG) of `www.example.com`  
validated

# DNSSEC Validation

What is the hash of  
example.com's public key record?

# DNSSEC Validation

Hash of example.com's public key record (DS)  
and hash's signature (RRSIG)

# DNSSEC Validation

What is the public key for  
.com?

# DNSSEC Validation

Public key for .com  
(DNSKEY)

# DNSSEC Validation

example.com's public key  
validated

# DNSSEC Validation

What is the hash of  
.com's public key?

# DNSSEC Validation

Hash of .com's  
public key (DS) + signature (RRSIG)

# DNSSEC Validation

What is the public key for  
root?

# DNSSEC Validation

Public key for root  
(DNSKEY)

# DNS Lookup

.com's public key  
validated

## DNSSEC - Trust Anchors

Trust anchor to validate root

- ⦿ Authoritative key
  - ⦿ Starting point in chain of trust.
- 

# Chain of Trust

Trust anchor validates  
root's public key

## AUTHENTICATED DENIAL OF EXISTENCE

- ◎ Validates that data does not exist
  - ◎ Prevents MITM attack
- 

## DNSSEC Resource Records

### ◎ **NSEC (Next Secure)**

Points to the next name in the zone, if record queried does not exist.

### Zone-Walking

A side effect allows discovery of zone content

## DNSSEC Resource Records

- ◎ **NSEC3** impedes zone-walking by using hashes.
  - ◎ **NSEC5** is being being discussed to solve zone-walking issue.
- 

# In DNS We Trust

Cryptographic signatures  
+ Chain-of-Trust

## DNS DATA IS AUTHENTICATED

- ◎ **Origin Authenticity**  
Data originated from a legitimate sender.
- ◎ **Data Integrity**  
Validation data was not modified in transit.
- ◎ **Authenticated Denial of Existence**  
Validation of absence of data,  
when it does not exist

# DNS, A Trusted Database

DNS is the most successful  
distributed database

DNSSEC transforms the DNS into an  
authenticated directory of information

## TRUSTING DNS DATA

We can trust:

- ◎ **DKIM / SFP (TXT)** - For fighting spam
- ◎ **MX** - Mail Exchange
- ◎ **SRV** - Service Discovery (VoIP and XMPP)
- ◎ **NAPTR** - Name Authority Pointer  
(Internet telephony)

## TRUSTING DNS with KEYS, CERTS, AND FINGERPRINTS

Confidence with data:

- ◎ **IPSECKEY** - IPsec Key Storage (VPN)
- ◎ **TSIG** - Transaction Signature  
for zone updates
- ◎ **SSHFP** - Secure Shell Fingerprints

# DANE

Secure Key Learning

DNS-based Authentication of  
Named Entities

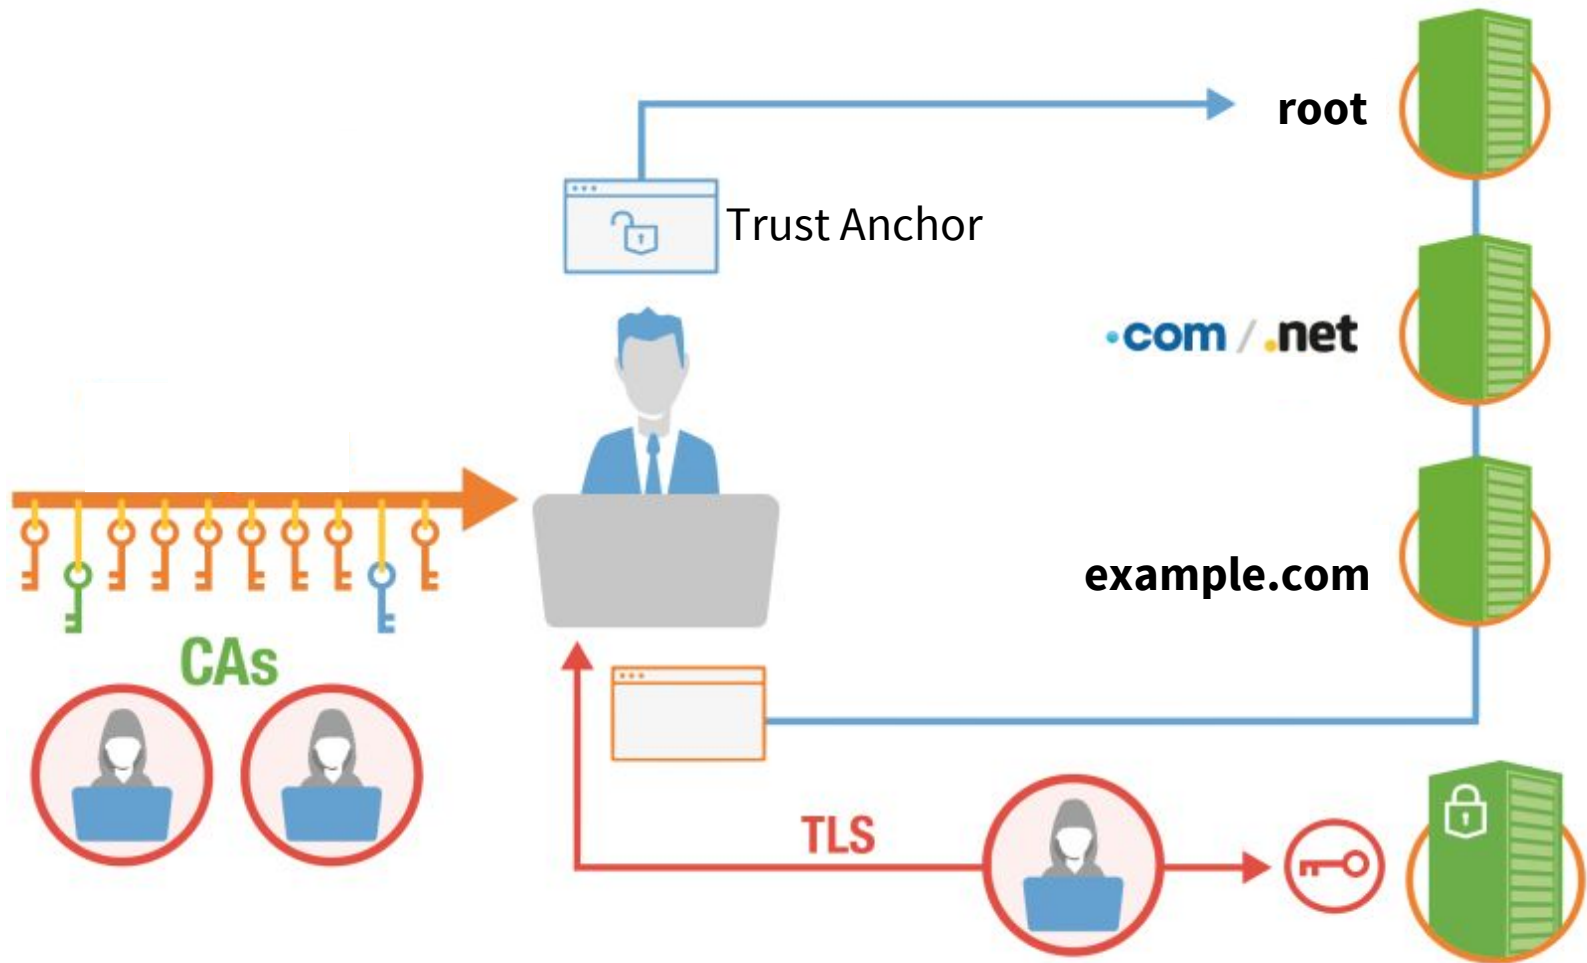

## DANE

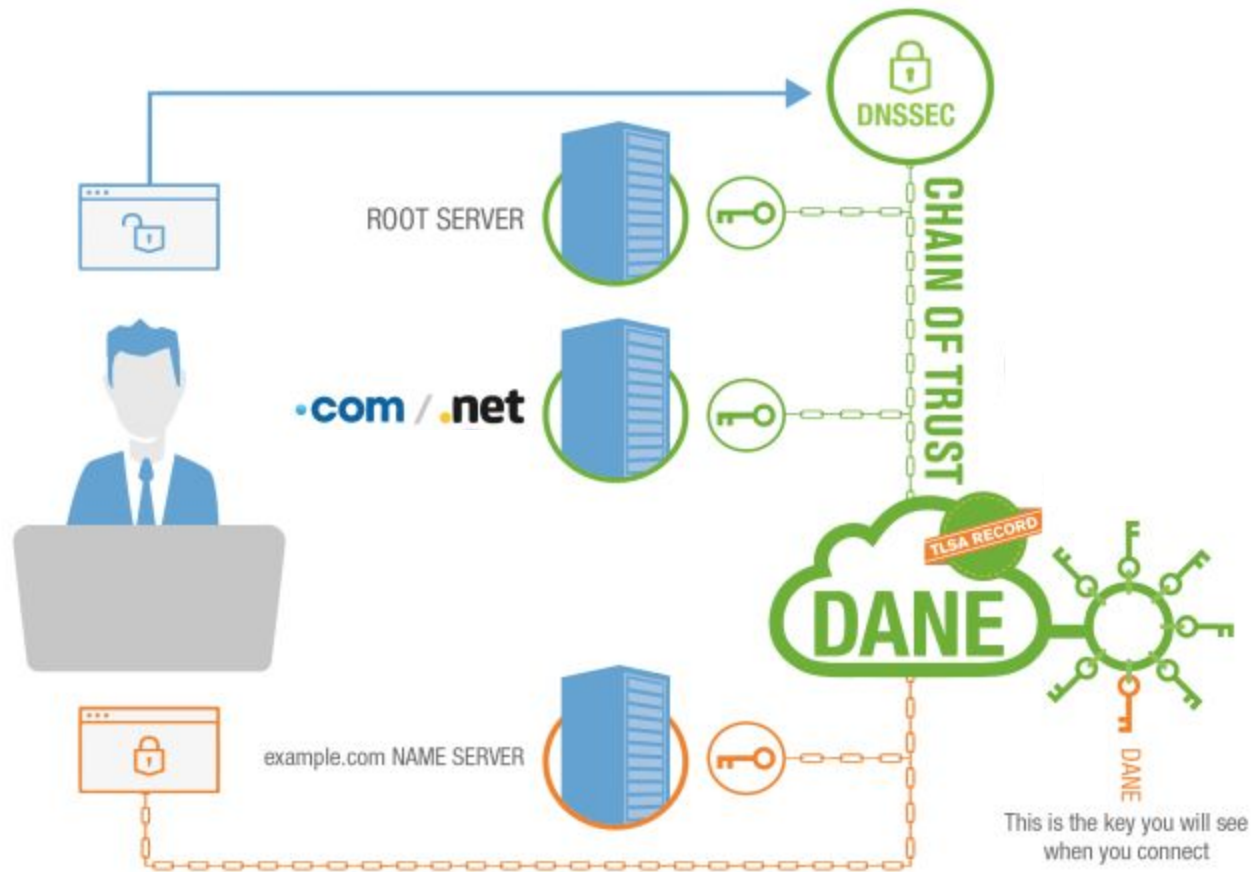

- Applications can easily discover authenticated keys for services by using information available in DNS.
- Applications can automatically establish secured communications

# Current SSL/TLS System

# TLS with DANE

## TLS In DNS

### TLSA - TLS associations

- ⦿ Stores a certificate or key for TLS
- ⦿ Can work in conjunction with certificate authorities

## TLSA and EMAIL

STARTTLS = SMTP + TLS

- ◎ STARTTLS is susceptible to MITM, Downgrade, and DNS attacks.
- ◎ DANE can authenticate and enforce TLS for the SMTP connection

## TLSA and UNIFIED COMMUNICATIONS

- ◎ DNSSEC is a great start,  
Validating NAPTR and SRV
- ◎ Instant Messaging: DANE can authenticate  
TLS to the XMPP server
- ◎ VoIP: DANE can authenticate  
TLS for the SIP connection

*But Wait...*  
**THERE'S  
MORE!!!**

DANE and WEB OF TRUST

OPENPGPKEY

Discoverable PGP Public Key for encryption

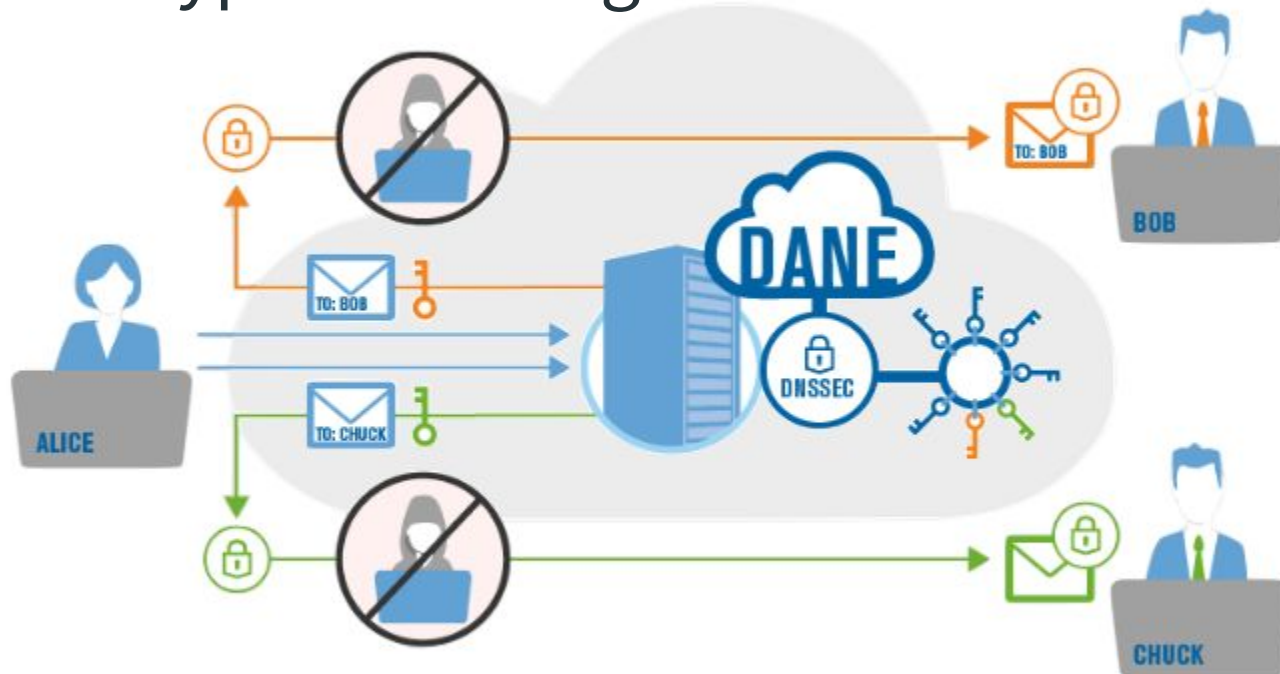

## DANE and EMAIL MESSAGES

### SMIMEA - S/MIME RR

Discoverable S/MIME key to digitally signed and encrypted messages

## DANE for IPSEC OPPORTUNISTIC ENCRYPTION

IPSECA - IPsec Public Key  
Discoverable VPN encryption

DANE with OFF-THE-RECORD

OTRFP - OTR Public Keys  
Safe key exchange

## DANE with BITCOINGS

PMTA - Payment Association

Discoverable secure association between  
service identifiers and payment information

# Why Not DNSSEC

The Arguments Against

A decorative network diagram in the top-left corner, consisting of various sized circles (nodes) connected by thin lines (edges). Some nodes are solid grey, while others are hollow with a grey outline. The network is dense and irregular.

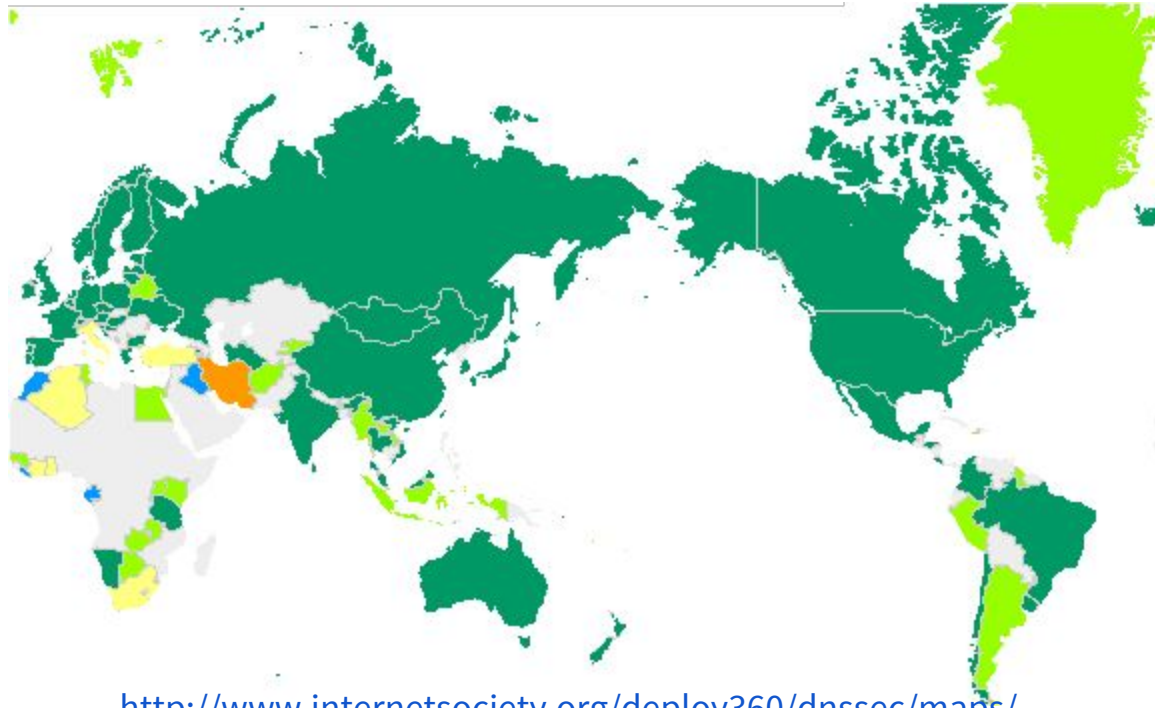

1

# DNSSEC Requires Critical Mass

Adoption

A decorative network diagram in the bottom-right corner, similar to the one in the top-left, featuring a cluster of interconnected nodes and lines.

# ccTLD DNSSEC Status 2016-01-04

<http://www.internetsociety.org/deploy360/dnssec/maps/>

- Experimental - Internal experimentation announced or observed
- Announced - Public commitment to deploy
- Partial - Zone is signed but not in operation
- DS in Root - Zone is signed and its DS has been published
- Operational - Accepting signed delegations and DS in root

# Second Level Domain Growth

## Signed SLDs in .com and .net

<http://scoreboard.verisignlabs.com/count-trace.png>

## Signed SLDs in nTLDs

<https://ntldstats.com/dnssec>

# DNSSEC Validation Usage

DNSSEC Validates ~25% of queries  
in the United States (US)

## ADOPTION

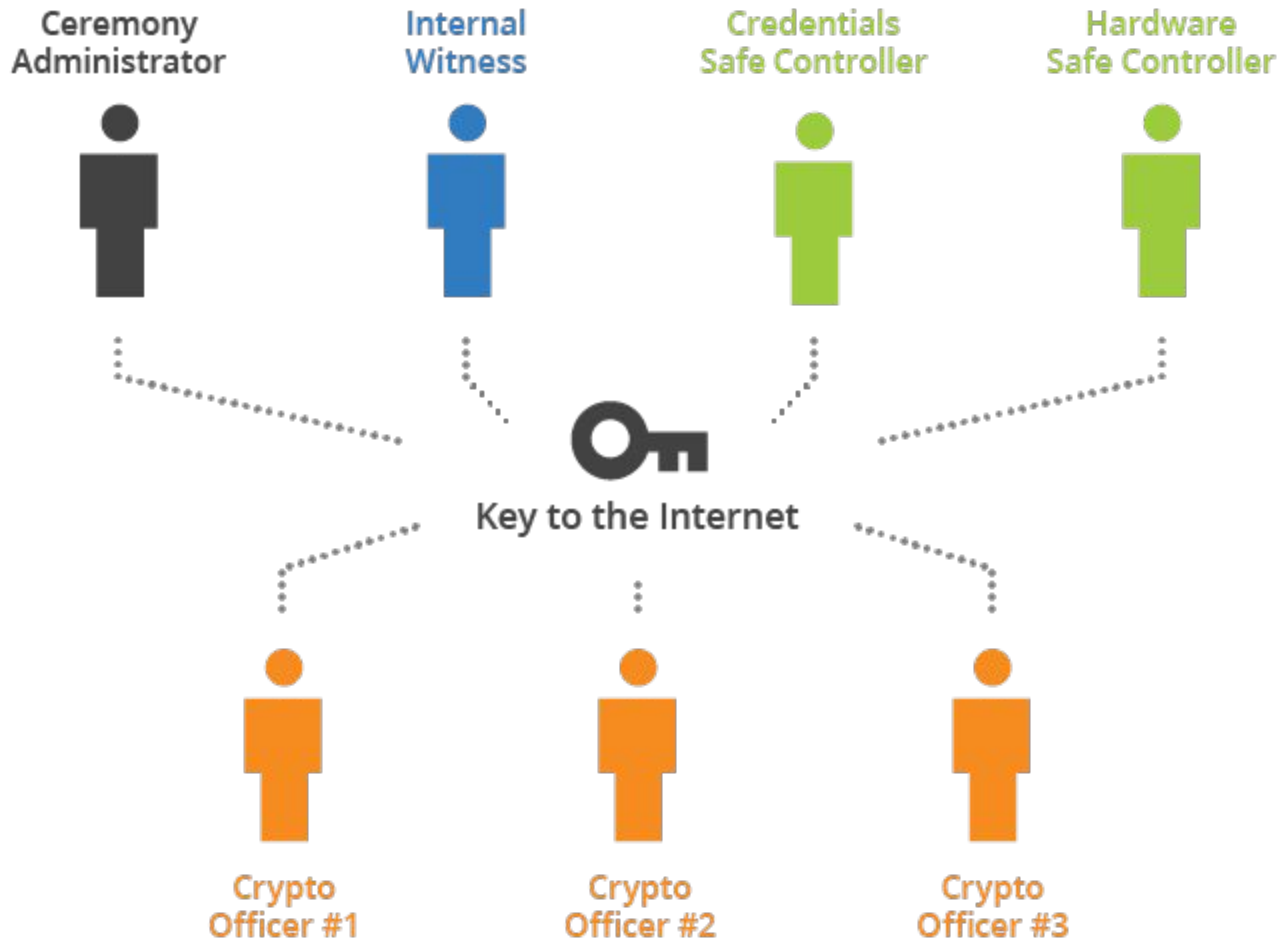

- ◎ ISPs: Comcast, AT&T, Vodafone, Sprint, Time Warner and many more
  - ◎ CDNs: CloudFlare, Akamai
  - ◎ Google Public DNS, Microsoft, Cisco
- 

A decorative network diagram in the top-left corner, featuring a cluster of interconnected nodes. Some nodes are represented by concentric circles, while others are simple dots. The connections are thin, light-gray lines.

# **Why Should I Trust Root?**

A decorative network diagram in the bottom-right corner, similar to the one in the top-left, showing a cluster of interconnected nodes with concentric circles and dots connected by thin, light-gray lines.

# Why Should I Trust Root?

# Why Should I Trust Root?

Ceremony  
Administrator

Internal  
Witness

Credentials  
Safe Controller

Hardware  
Safe Controller

Multi Stakeholder

No single entity has the “master key”

Key to the Internet

Key Signing Ceremony

is public, audited, and tightly controlled

Changes would be detected

<https://www.cloudflare.com/dnssec/root-signing-ceremony/>

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by small circles, some of which are larger and have concentric circles inside, suggesting a hierarchical or multi-layered structure. The lines are thin and gray, connecting the nodes in a non-linear fashion.

1

**EXPENSIVE**

To Deploy

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of nodes connected by lines, with some nodes being larger and more prominent than others, indicating a central or hub-like node in the network.

## DNSSEC is EXPENSIVE

- ◎ **CPU** - There will be an increase in CPU load. With modern processors most will be okay.
    - Resolvers caching helps
    - Authoritative servers signing frequently or many zones will be more taxed
  - ◎ **Storage** - Expect zone files to increase at least 3x; storage is inexpensive
- 

## DNSSEC is EXPENSIVE

- ◎ **RAM** - Larger answer sets and zone files so higher memory usage; 4x as many records; commodity RAM is inexpensive
- ◎ **Bandwidth** - 5x larger responses but still relatively small

## DNSSEC COMPATIBILITY

### Extension Mechanisms for DNS (EDNS0)

- ◎ DNS UDP packets larger than 512 bytes
- ◎ DNS over TCP
- ◎ Non-compliant DNS implementations;  
Check for fragmentation/truncation
- ◎ Adjust ACLs accordingly

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The diagram is partially cut off by the top and left edges of the slide.

1

# Incomplete

“Last Mile” / “First Hop” Issue

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of interconnected nodes and lines, with some nodes having concentric circles. The diagram is partially cut off by the bottom and right edges of the slide.

## “Last Mile” / “First Hop” Issue

- Chain of trust is at the validating resolver, which is traditionally external to the system.
- Communication between the validating DNS server and clients needs to be secured.
- Solutions available, but no standard implementation.

## “Last Mile” / “First Hop” Solutions

- ◎ getdns: DNSSEC aware applications  
<https://getdnsapi.net/>
- ◎ Fedora’s solutions: Include a validating resolver, Unbound  
[https://fedoraproject.org/wiki/Changes/Default\\_Local\\_DNS\\_Resolver](https://fedoraproject.org/wiki/Changes/Default_Local_DNS_Resolver)
- ◎ Microsoft’s solution: IPsec tunnel from every client to the DNS server  
<https://technet.microsoft.com/en-us/library/ee649178%28v=ws.10%29.aspx>
- ◎ DNSCrypt: authenticates communications between a DNS client and resolver  
<https://dnscrypt.org/>

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by small circles, some of which are larger and have concentric circles inside, suggesting a hierarchical or multi-layered structure. The lines are thin and gray, connecting the nodes in a non-linear fashion.

1

**Alternatives?**

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of nodes connected by lines, with some nodes being larger and having concentric circles, indicating a similar hierarchical or multi-layered structure. The lines are thin and gray.

## ALTERNATIVES

Proposed alternatives:

- ⊙ Do nothing
  - ⊙ DNSCurve
- Encrypts DNS traffic

## ALTERNATIVES

### DNSCurve

- ⊙ Lacking adoption  
Only OpenDNS and Cryptostorm
  - ⊙ Not a question of either/or  
*DNSCurve doesn't prevent our adoption of DNSSEC — they are not mutually exclusive.*  
- OpenDNS
- 

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The overall style is technical and modern.

# **Take Advantage of DNSSEC**

Validation for Desktops

A decorative network diagram in the bottom-right corner, similar to the one in the top-left, showing a cluster of interconnected nodes and lines in a technical, grey-toned style.

## Test If DNSSEC Is Enabled

◎ Is Your Internet Up-to-date?

# **Take Advantage of DNSSEC**

Validation for Resolvers/Routers

# Dnsmasq

## Enable DNSSEC Validation

```
--dnssec \  
--trust-anchor=.,19036,8,2,49  
AAC11D7B6F6446702E54A1607371607A1A418  
55200FD2CE1CDDE32F24E8FB5 \  
--dnssec-check-unsigned
```

## DD-WRT Enable DNSSEC Validation

Under Services

Enter the parameters for Dnsmasq

### DNSMasq

DNSMasq ☒ Enable ☐ Disable

Local DNS ☐ Enable ☒ Disable

No DNS Rebind ☒ Enable ☐ Disable

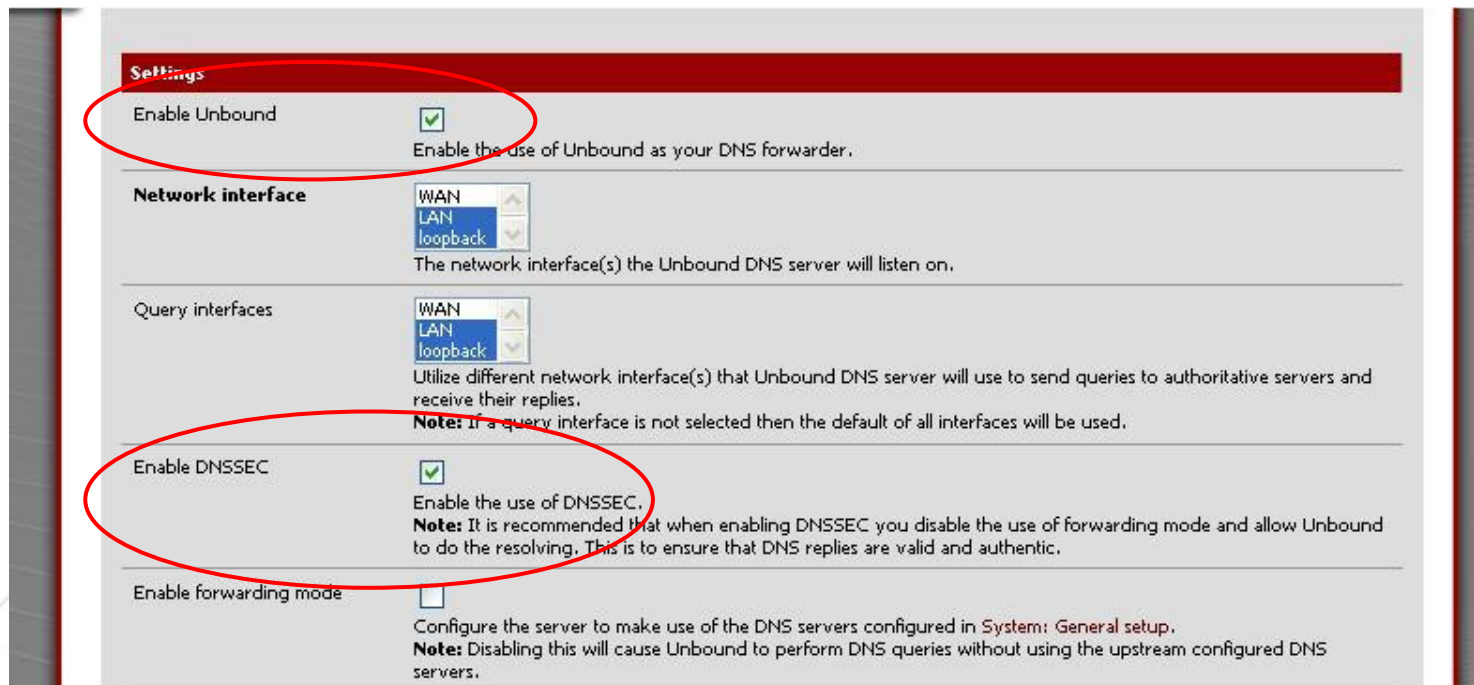

#### Additional DNSMasq Options

```
--dnssec --trust-  
anchor=.,19036,8,2,49AAC11D7B6F6446702E54A1607371607A1A41855200F  
D2CE1CDDE32F24E8FB5 --dnssec-check-unsigned
```

## pfSense Enable DNSSEC Validation

Enabled by default

Goto: Services > DNS Resolver

**Settings**

**Enable Unbound** ☒   
Enable the use of Unbound as your DNS forwarder.

**Network interface**   
WAN   
LAN   
loopback   
The network interface(s) the Unbound DNS server will listen on.

**Query interfaces**   
WAN   
LAN   
loopback   
Utilize different network interface(s) that Unbound DNS server will use to send queries to authoritative servers and receive their replies.   
**Note:** If a query interface is not selected then the default of all interfaces will be used.

**Enable DNSSEC** ☒   
Enable the use of DNSSEC.   
**Note:** It is recommended that when enabling DNSSEC you disable the use of forwarding mode and allow Unbound to do the resolving. This is to ensure that DNS replies are valid and authentic.

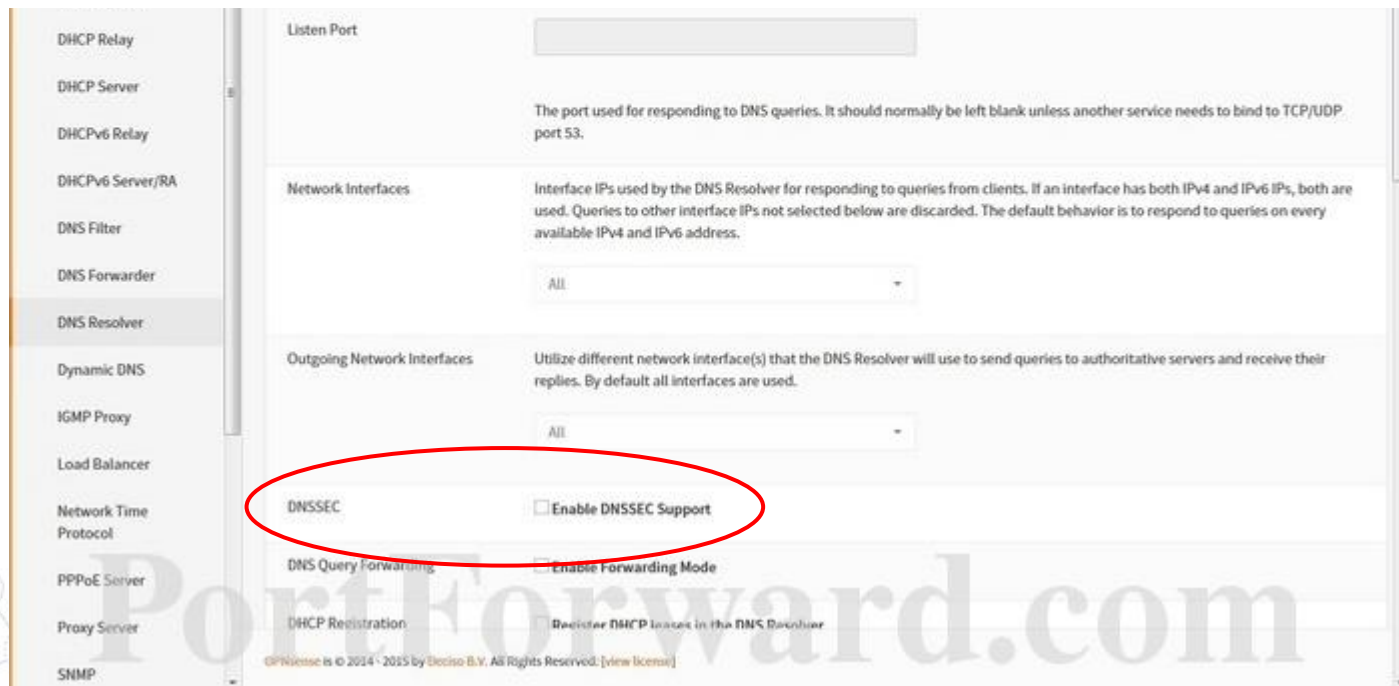

**Enable forwarding mode** ☐   
Configure the server to make use of the DNS servers configured in System: General setup.   
**Note:** Disabling this will cause Unbound to perform DNS queries without using the upstream configured DNS servers.

## OPNsense Enable DNSSEC Validation

Resolver not enable by default

Goto: Services > DNS Resolver

The screenshot shows the OPNsense web interface for the DNS Resolver service. The left sidebar lists various services, with 'DNS Resolver' selected. The main content area contains several configuration sections:

- Listen Port:** A text input field for the port used for responding to DNS queries. The default is blank, with a note that it should normally be left blank unless another service needs to bind to TCP/UDP port 53.
- Network Interfaces:** A dropdown menu showing 'All'. A note states that interface IPs are used for responding to queries, and queries to other interfaces are discarded.
- Outgoing Network Interfaces:** A dropdown menu showing 'All'. A note states that these interfaces are used to send queries to authoritative servers and receive replies.
- DNSSEC:** This section is circled in red. It contains a checkbox labeled 'Enable DNSSEC Support', which is currently unchecked.
- DNS Query Forwarding:** Contains a checkbox labeled 'Enable Forwarding Mode', which is also unchecked.
- DHCP Registration:** Contains a link to 'Register DHCP leases in the DNS Resolver'.

At the bottom, there is a copyright notice: 'OPNsense is © 2014 - 2015 by Deciso B.V. All Rights Reserved. [view license]'.

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by circles of varying sizes, some with concentric rings, and the lines are thin and grey. The overall structure is organic and sprawling, resembling a molecular or biological network.

# **Take Advantage of DNSSEC**

Validation for Applications

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It consists of a cluster of interconnected nodes and lines, with nodes represented by circles of different sizes and some having concentric rings. The lines are thin and grey, creating a complex, web-like pattern.

## Use for UC and VoIP

Jitsi

[https://modules.prosody.im/mod\\_s2s\\_auth\\_dane.html](https://modules.prosody.im/mod_s2s_auth_dane.html)
- ◎ Tigase (expected in 7.2)  
<https://projects.tigase.org/issues/1626>

## Clients

- ◎ Gajim  
<http://www.slideshare.net/MenandMice/dane-webinarsep2014>
- ◎ Irssi  
<https://github.com/irssi/irssi/commit/d826896f74925f2e77536d69a3d1a4b86b0cec61>

XMPP servers with DANE records

<https://xmpp.net/reports.php#dnssecdane>

## Use Email and TLSA

- ◎ Postfix

Open-source MTA agent that attempts to be fast, easy to administer, and secure.

- ◎ Exim

General and flexible mailer with extensive facilities for checking incoming e-mail.

A decorative background graphic consisting of a network of interconnected nodes and lines, resembling a molecular structure or a data network. The nodes are represented by circles of varying sizes, some with concentric circles, and the lines are thin and grey. The network is more dense on the left side and fades out towards the right.

# **Take Advantage of DNSSEC**

Domain Owners and Sysadmins

Using on Domain

## Registrars

- ◎ Hover
- ◎ Gandi
- ◎ GoDaddy
- ◎ Google

ICANN List:

More: <http://www.icann.org/en/news/in-focus/dnssec/deployment>

## Using Authoritative Servers

- ◎ **BIND 9** - DNS reference implementation can automate zone signing, even for dynamic zones.
- ◎ **PowerDNS** - Database backend
- ◎ **Knot-DNS** - High performance, scales well
- ◎ **NSD** - Fast, simple, secure
  
- ◎ **Windows 2012** -Dynamic zone updates with Active Directory; no TLSA until 2016

<https://technet.microsoft.com/en-us/library/dn593674.aspx>

## Tools

### **OpenDNSSEC**

Open-source turn-key solution for DNSSEC

<https://www.opendnssec.org>

### **DNSSEC-Tools**

Set of software tools, patches, applications, wrappers, and extensions to ease the deployment of DNSSEC related technologies

<http://www.dnssec-tools.org/>

# Conclusion

It's almost over

## CONCLUDING ACTIONS

- ◎ Spread awareness
  - ◎ Inquire your service providers
  - ◎ Adopt
- Need help?
- My contact info is in the slides

**Everyone, embrace a safer world**

## CONCLUSION

- ◎ DNS is fundamental to the Internet, but it is unsafe
- ◎ DNSSEC is the next evolutionary step in securing the Internet.
- ◎ DNSSEC is the foundation for more types of secure data transactions.

# Thank You Carlos Meza

Special thank you to Josh  
Kuo of the Internet  
Systems Consortium and  
DeepDive Networking.

# Troubleshooting

## When Duty Calls

<https://xkcd.com/386/>

The top right corner of the slide features a network diagram with nodes and connecting lines. Overlaid on this is a green logo for 'digitalroots.com', which consists of a stylized 'E' shape made of horizontal bars, with the text 'digitalroots.com' underneath it.

## Common Problems

### **Security Lameness**

Similar to Lamé Delegation but with DS RRs instead of NS RRs, resulting in a broken chain-of-trust.

### **Incorrect Time**

Keys and certificates that have a validity time frame are dependant on correct time.

### **Invalid Trust Anchors**

Will cause all queries to fail

A network diagram in the bottom left corner, showing a cluster of nodes connected by lines, similar to the one in the top right.

<http://users.isc.org/~jreed/dnssec-guide/dnssec-guide.html#troubleshooting-common-problems>

## DNS Lookup Utilities

<u>Option</u>	<u>dig</u>	<u>drill</u>
Set DO bit	+dnssec	-D
Trace delegation	+trace	-T
Chase signatures	+sigchase	-S
Set CD bit	+ <code>[no]</code> cdflag	-o CD / -o cd
Return equivalent DS for DNSKEY		-s
Use TCP	+tcp	-t

# Thank You Carlos Meza

Special thank you to Josh  
Kuo of the Internet  
Systems Consortium and  
DeepDive Networking.

[carlos@digitalr00ts.com](mailto:carlos@digitalr00ts.com)  
[@digitalr00ts](https://twitter.com/digitalr00ts)

A decorative network diagram in the top-left corner, featuring a cluster of interconnected nodes. Some nodes are represented by solid grey circles, while others are concentric circles with a grey outer ring and a white center. These nodes are connected by thin, light-grey lines, forming a complex web-like structure.

# **Technically Speaking**

Records, Algorithms, Key Rollovers

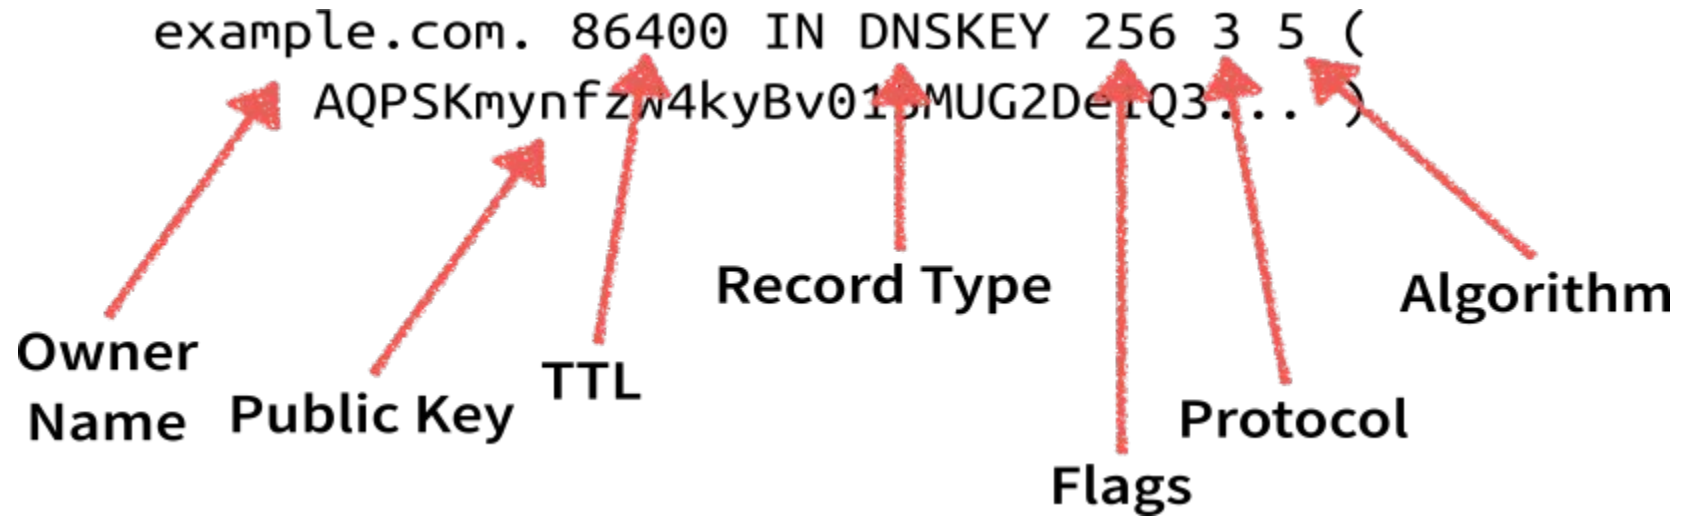

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of interconnected nodes, including solid grey circles and concentric circles with grey outer rings and white centers, connected by thin, light-grey lines.

## DNSSEC Bits

- ◎ **DO - DNSSEC OK**  
Indicates the resolver is requesting and able to accept DNSSEC
- ◎ **CD - Checking Disabled**  
Indicates the resolver is intentionally does not want validation, even if available
- ◎ **AD - Authenticated Data**  
Indicates in a response that the data has been verified

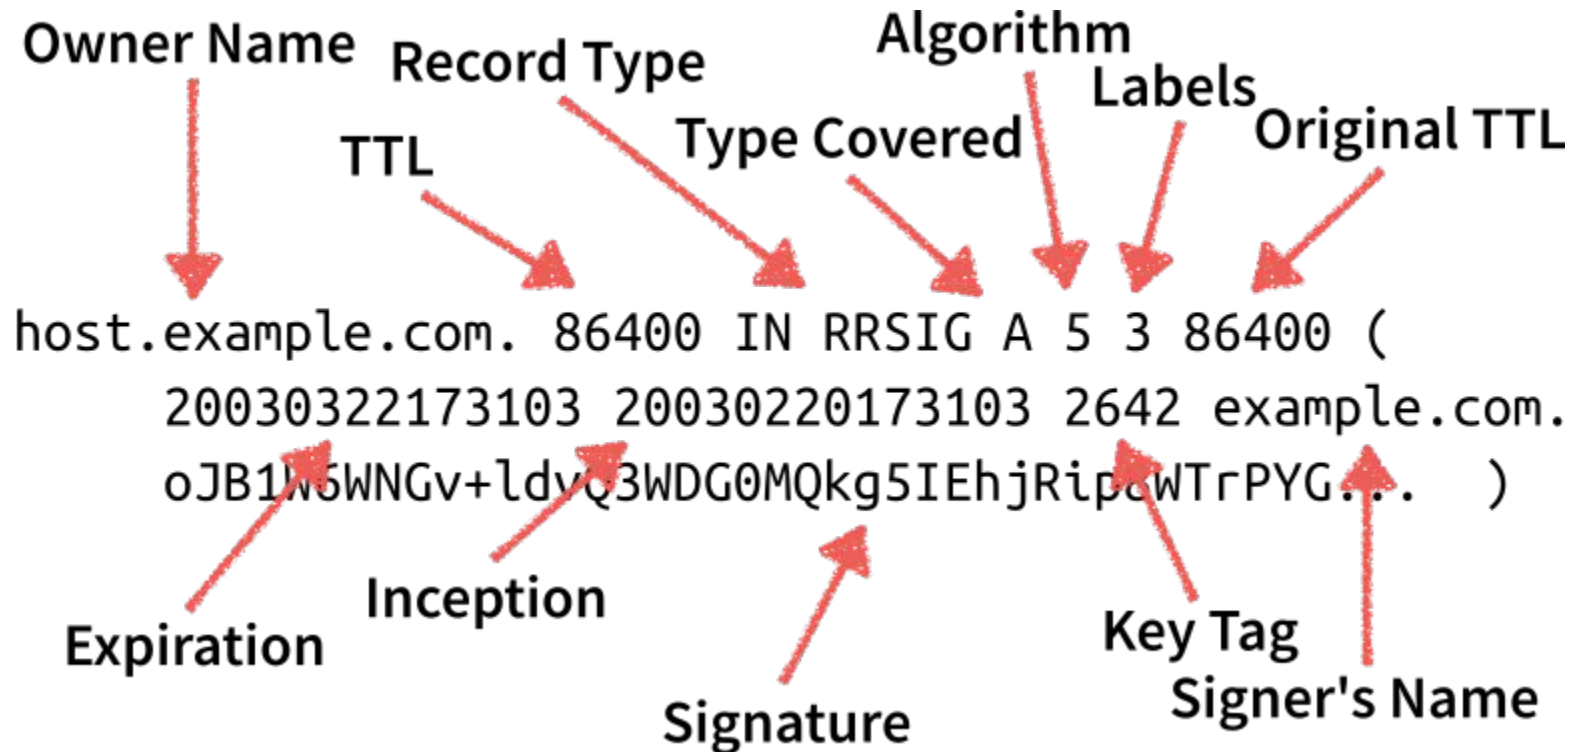

# DNSKEY RR

**Flags** : 256 - Zone Signing Key, 257 - Key Signing Key

**Protocol** fixed value 3; for backward compatibility with early versions of the KEY record

# RRSIG RR

**Signature** = sign(RRSIG\_RDATA + RR(1) + RR(2)... )

RRSIG\_RDATA is the RRSIG RDATA fields with the Signer's Name field in canonical form and the Signature field excluded

RR(i) = owner + type + class + TTL + RDATA length + RDATA

# DS RR

**Digest** = digest\_algorithm( DNSKEY owner name + DNSKEY RDATA)

DNSKEY RDATA = Flags + Protocol + Algorithm + Public Key

**Digest Type:** Hash algorithm used to create the Digest value

1 - SHA-1 | 2 - SHA-256 | 3 - GOST R 34.11-94 | 4 - SHA-384

## DNSSEC Resource Records

- ◎ NSEC/NSEC3/NSEC5 - Denial of existence
  - NSEC3PARAM - Hash type, iterations, salt, etc

## TLSA Certificate Association

### **With current CA system**

- 1 - “CA constraint”  
Specifies which CA to use
- 2 - “Service certificate constraint”  
Specifies which certificate is valid

### **Without current CA system**

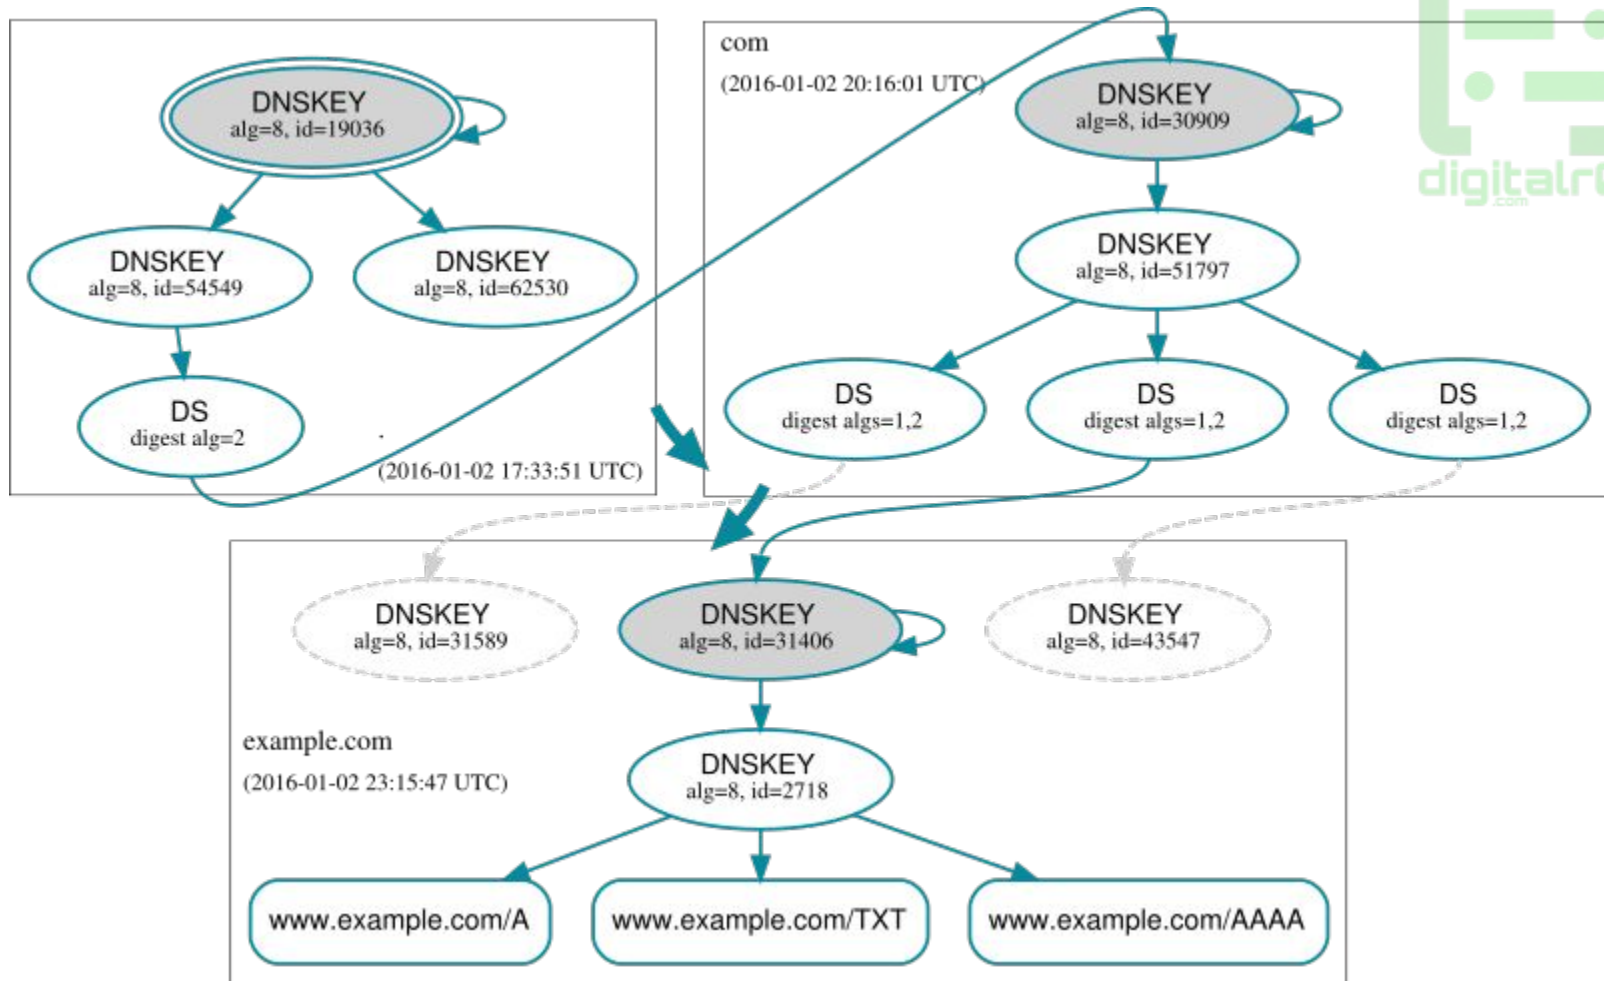

- 3 - “trust anchor assertion”  
Domain has its own CA
- 4 - “domain-issued certificate”  
Certificate w/o need of third party

# Algorithms

- 1 - RSA/MD5 [RSAMD5]
- 2 - Diffie-Hellman [DH]
- 3 - DSA/SHA1 [DSA]
- 4 - Elliptic Curve [ECC]
- 5 - RSA/SHA-1 [RSASHA1]
- 6 - DSA-NSEC3-SHA1 [DSA-NSEC3-SHA1]
- 7 - RSASHA1-NSEC3-SHA1 [RSASHA1-NSEC3-SHA1]
- 8 - RSA/SHA-256 [RSASHA256]

- 9 - Reserved
- 10 - RSA/SHA-512 [RSASHA512]
- 11 - Reserved
- 12 - GOST R 34.10-2001 [ECC-GOST]
- 13 - ECDSA Curve P-256 with SHA-256 [ECDSAP256SHA256]
- 14 - ECDSA Curve P-384 with SHA-384 [ECDSAP384SHA384]

<http://www.iana.org/assignments/dns-sec-alg-numbers/dns-sec-alg-numbers.xhtml>

Chain of Trust - example.com

## Changing Keys

The ZSK publishes more signatures than the KSK, giving attackers more data to work with.

- ◎ ZSK - Change every 3 to 12 months
- ◎ KSK - Change every years 2 - 5 years;  
Use stronger encryption than ZSK

Extra signatures and keys are okay as long as as there is a validate a chain of trust.

## Rollover Methods - ZSK

### Pre-publication

Smaller zone file, but more steps

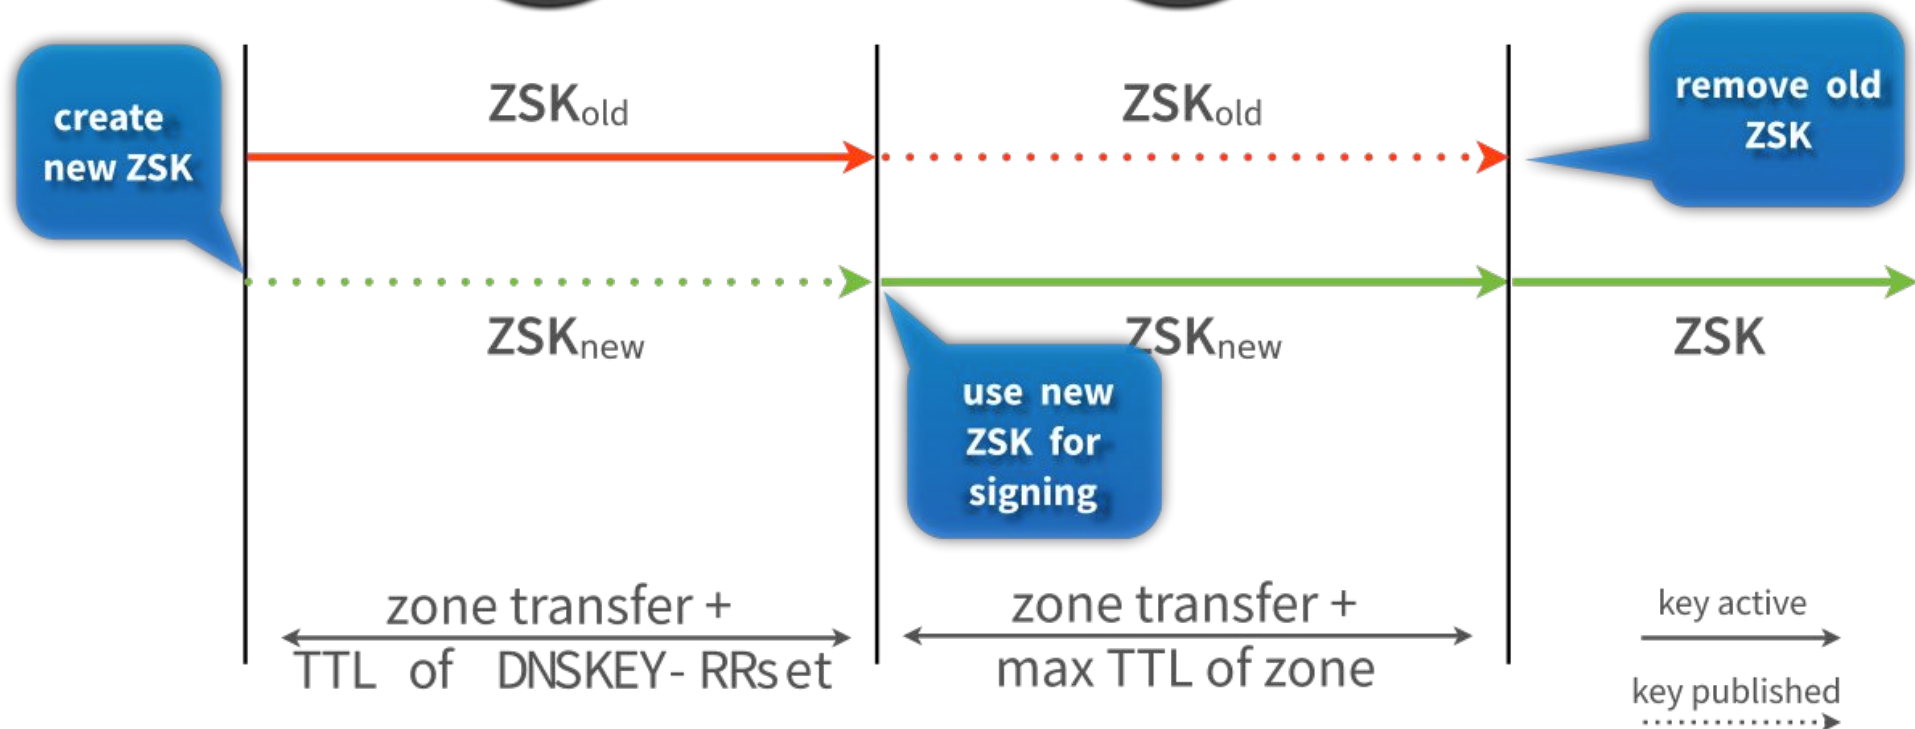

1. Publish new ZSK
2. Generate new RRSIG after at least one TTL
3. Removing the old key after at least another TTL

### Double Signature

Simpler but larger zone files

1. Publish new ZSK and sign zone
2. Remove old ZSK and RRSIGs after at least one TTL

# ZSK Pre-publication Rollover

## Rollover Methods - KSK

### Double-DS

DNSKEY RRset is smaller, but 2 updates to parent zone

1. Publish new DS record
2. Change key after longest TTL
3. Remove old DS record after longest TTL

### Double-KSK

Single update to parent zone, but larger DNSKEY RRset

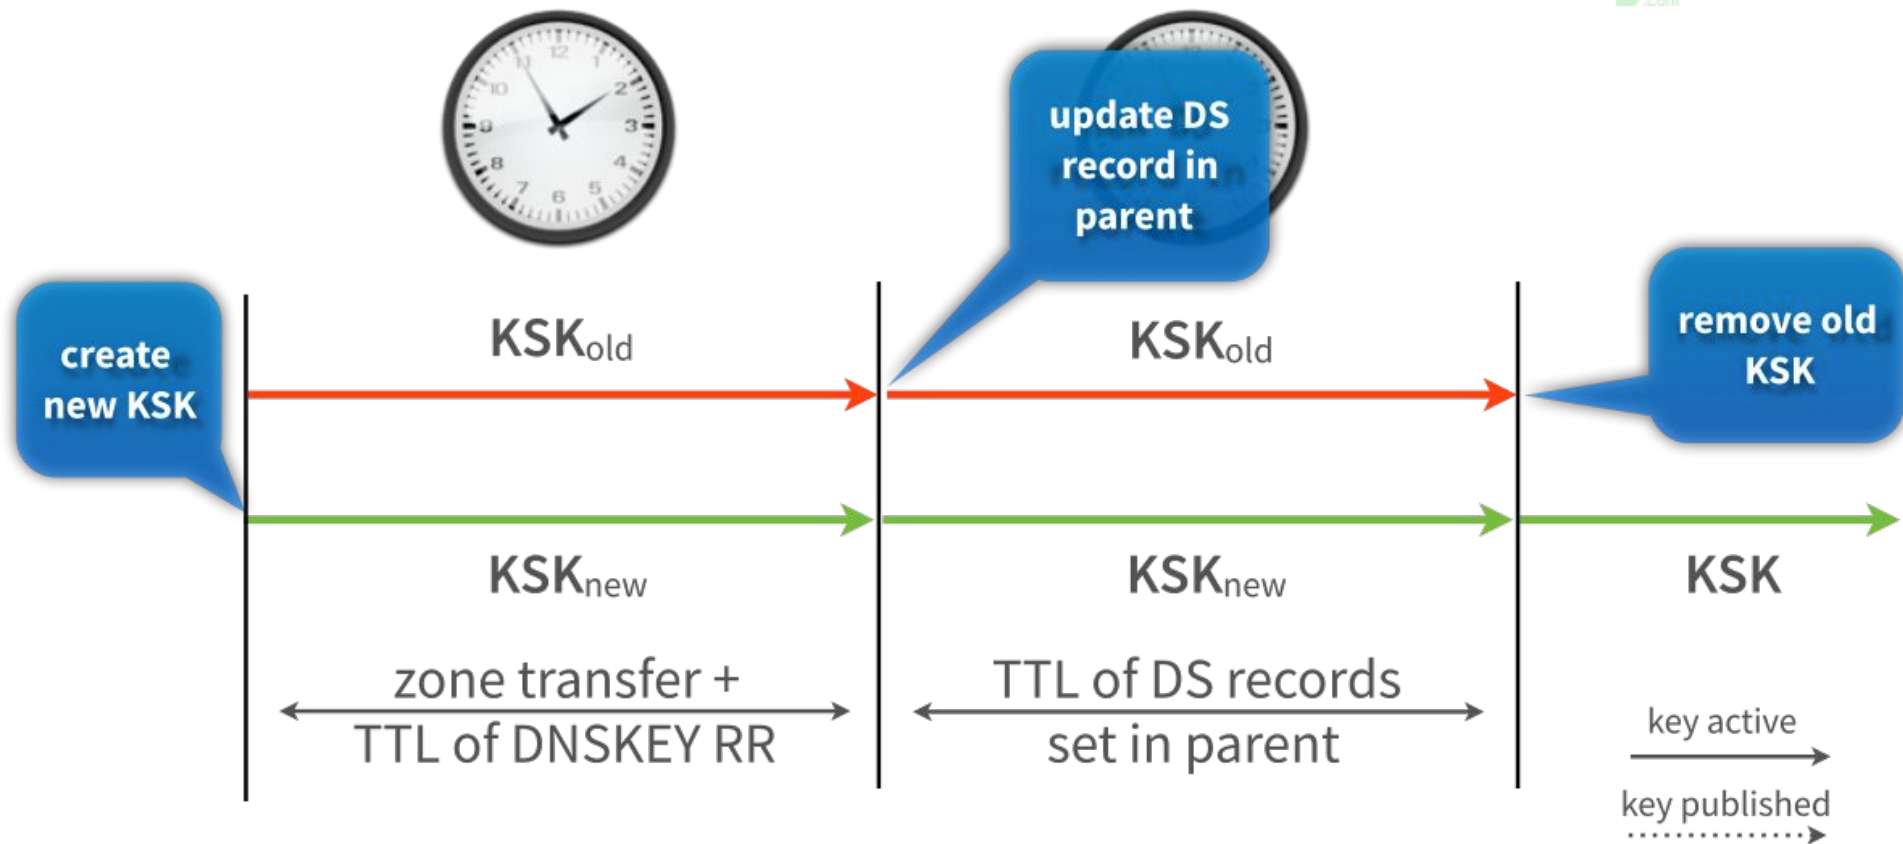

1. New DNSKEY RRset;  
2 KSK + RRSIGs
2. Update DS record after longest TTL
3. Remove old key after longest TTL

### Double-RRset

Fastest, but larger DNSKEY RRset and 2 updates to parent zone

1. Publish new DS RR and DNSKEY RRset
2. Remove old DS RR and key after longest TTL

# KSK Double-Key Rollover

# SSL/TLS Can't Save You

SSL/TLS provides privacy and data integrity between two applications.

## SSL/TLS, What is it?

SSL (Secure Sockets Layer) establishes an encrypted connection between a web server and a browser.

All data passed over this connection is secure.

TLS (Transport Layer Security) is the successor to SSL, but is often referred to as SSL as well.

## SSL/TLS Certificate Authorities

SSL/TLS uses certificates obtained from a 3rd party called a CA (Certificate Authority).

SSL/TLS doesn't tell you if you've been sent to the correct site, it only tells you if the DNS matches the name in the certificate.

# SSL/TLS Vulnerability

## **BEAST**

Cipher block chaining (CBC) vulnerability

## **Heartbleed**

Vulnerability in the OpenSSL allowing memory to be read

## **POODLE**

Downgrade attack causing clients to fallback to SSLv3

## **FREAK**

Forces cryptographic downgrade

# SSL/TLS Vulnerability

## BEAST

Cipher block chaining (CBC) vulnerability

## Heartbleed

Vulnerability in the Open SSL allowing memory to be read

## POODLE

Downgrade attack causing clients to fallback to SSLv3

Implementation Issues

Usability

RFC Predates Logjam, FREAK, Bicycle

<https://tools.ietf.org/html/rfc7457>

<https://www.eff.org/observatory>

## General CA Issues

- ◎ Any CA can issue certificates for any entity on the Internet
- ◎ CAs delegate trust to subordinate certification authorities
- ◎ CA-signed certificates for unqualified domain names, i.e. localhost, exchange, webmail  
<https://www.eff.org/deeplinks/2011/04/unqualified-names-ssl-observatory>
- ◎ Trust of a CA requires storage of a CA's root certificate in the client's certificate store.  
This can be tampered

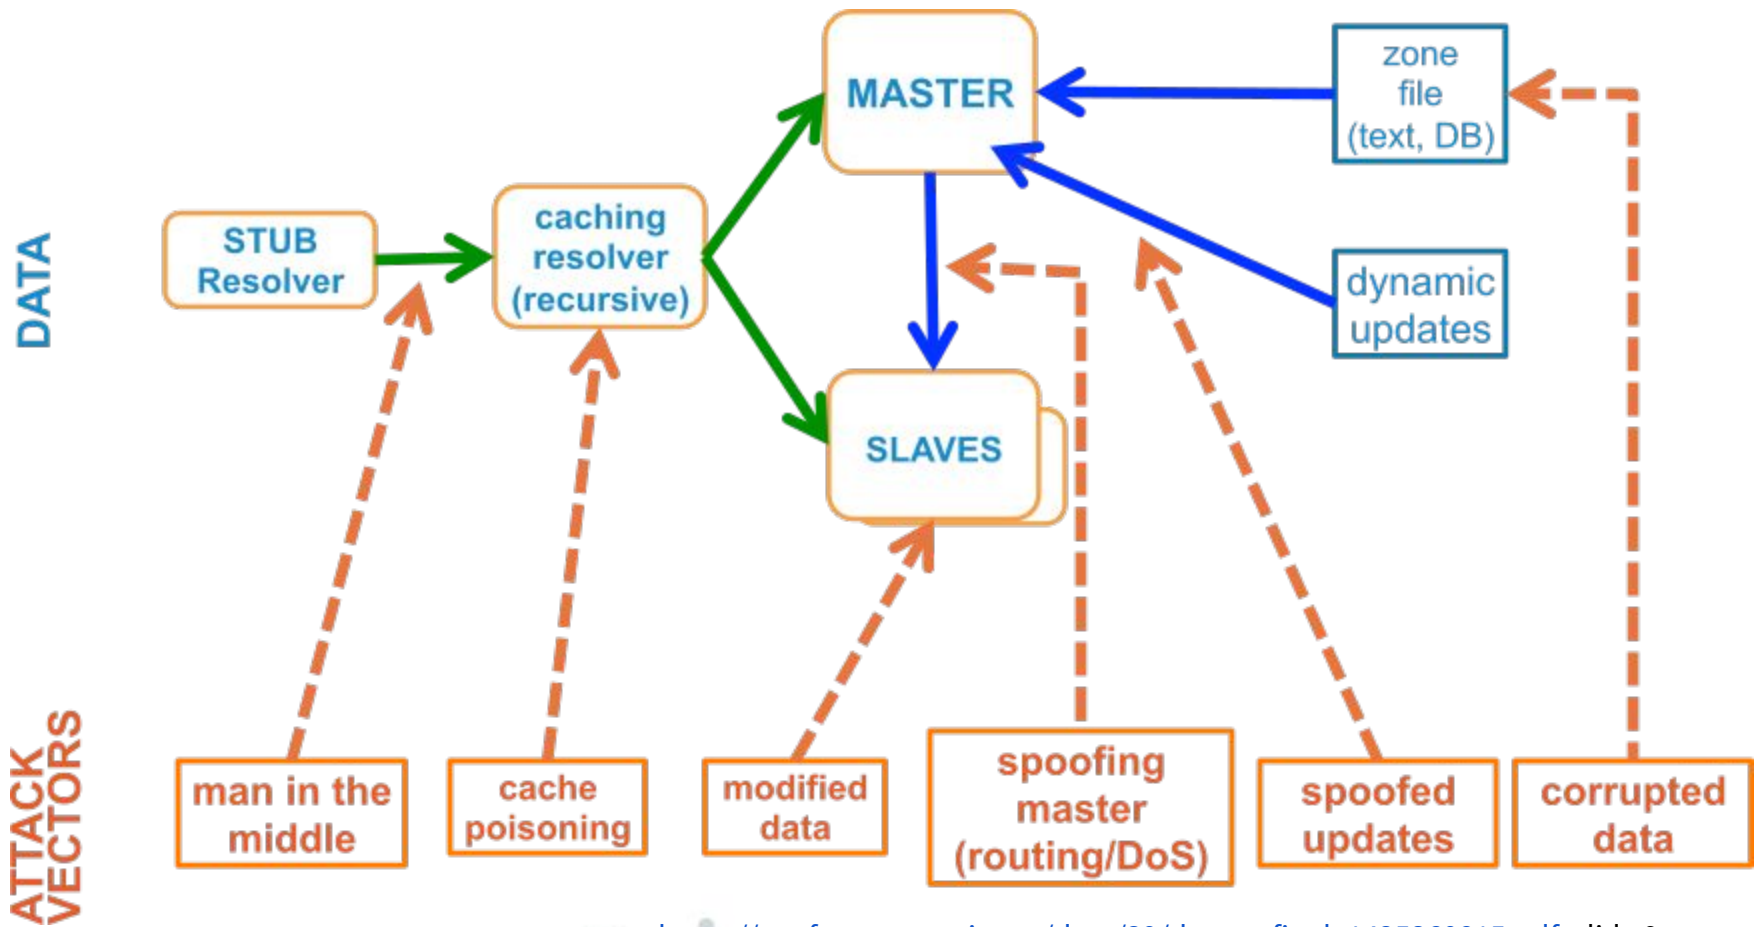

## CAs are vulnerable

- ◎ 2011 - Comodo breach results in fraudulent certificates being issued  
<https://www.comodo.com/Comodo-Fraud-Incident-2011-03-23.html>
- ◎ 2011 - DigiNotar compromise results in issuing of fraudulent certificates  
[http://www.theregister.co.uk/2011/09/06/diginotar\\_audit\\_damning\\_fail/](http://www.theregister.co.uk/2011/09/06/diginotar_audit_damning_fail/)
- ◎ 2012 - Trustwave issues man-in-the-middle digital certificate  
<http://www.computerworld.com/article/2501291/internet/trustwave-admits-issuing-man-in-the-middle-digital-certificate--mozilla-debates-punishment.html>
- ◎ 2013 - ANSSI issues unauthorized certificates for Google domains  
<https://googleonlinesecurity.blogspot.com.au/2013/12/further-improving-digital-certificate.html>

## SSL/TLS Will Save Us 2015

- ◎ **Lenovo Is Breaking HTTPS with Superfish**  
<https://www.eff.org/deeplinks/2015/02/further-evidence-lenovo-breaking-https-security-its-laptops>
- ◎ **D-Link leaks private keys and passphrases**  
<https://threatpost.com/d-link-accidentally-leaks-private-code-signing-keys/114727/>
- ◎ **Symantec issuing rogue Google certificates**  
<https://googleonlinesecurity.blogspot.com/2015/09/improved-digital-certificate-security.html>
- ◎ **Dell ships computers with private keys**  
<http://krebsonsecurity.com/2015/11/security-bug-in-dell-pcs-shipped-since-815/>
- ◎ **Microsoft leaks private key for Xbox Live**  
<http://www.pcworld.com/article/3013113/security/microsoft-updates-trust-list-after-private-key-for-xbox-live-leaks.html>

# DNS Vulnerabilities and Attack Surface

## DNSSEC

DNSSEC is a set of extensions(EDNS0) to DNS that guarantees:

- ◎ **Origin Authority**  
Data was supplied by a rightful source
- ◎ **Data Integrity**  
Data has not been tampered with
- ◎ **Authenticated denial of existence**  
Non-existent data can be verified

## DNSSEC Resource Records

### ◎ **DNSKEY - DNS Key**

Public keys (ZSK and KSK)

- **ZSK - Zone Sign Key** signs RRsets in zone
- **KSK - Key Sign Key** signs the ZSK's DNSKEY

### ◎ **RRSIG - Resource Record Signature**

RRset signature generated from private ZSK

### ◎ **DS - Delegation Signer**

Hash that identifies the KSK's DNSKEY of a delegated zone from the parent zone

## Verisign DANE Test Sites

**good.dane.verisignlabs.com**

There is a valid, signed TLSA record for the certificate of this server.

**bad-hash.dane.verisignlabs.com**

The TLSA record for this server has an incorrect hash value, although it is correctly signed with DNSSEC.

**bad-params.dane.verisignlabs.com**

The TLSA record for this server has a correct hash value, incorrect TLSA parameters, and is correctly signed with DNSSEC. NOTE: The current Firefox plugin accepts these TLSA records as valid.

**bad-sig.dane.verisignlabs.com**

The TLSA record for this server is correct, but the DNSSEC chain-of-trust is broken and/or has a bad signature.

## Use DNSSEC on Routers

### **DD-WRT**

<https://www.dd-wrt.com/phpBB2/viewtopic.php?p=966789&highlight=&sid=3d97b7b967f25009ad2eeb7393f2c1e1>

### **pfSense / OPNsense**

[https://doc.pfsense.org/index.php/Unbound\\_DNS\\_Resolver](https://doc.pfsense.org/index.php/Unbound_DNS_Resolver)

These router projects include the  
Unbound DNS Resolver

~~Unbound~~

## Using Validating Resolvers

- ◎ **BIND 9** - Response Policy Zones
- ◎ **Unbound** - Fast, secure, and can temporarily mark zones as insecure
- ◎ **Dnsmasq** 2.69 and later - light weight
- ◎ **Windows 2008 R2** - yeah

A decorative network diagram at the top of the slide, featuring a complex web of interconnected nodes and lines. A central node is highlighted with a blue double quote symbol (") inside a dashed circle.

“

*DNSSec is an absolute requirement  
if we want to ... use the Internet for  
anything non-trivial*

**Cricket Liu**

Leading expert on the Domain Name System (DNS)

“Why you need to deploy DNSSec now,” InfoWorld, Aug 5, 2014

“

*The Internet needs this technology  
and it needs it now*

**Vint Cerf**

Father of the Internet

“DNSSEC Industry Coalition Meets with Google’s Chief Internet Evangelist Vint Cerf and Internet Researcher Dan Kaminsky”,  
Your Public Interest Registry, March 18 2009

“

*One of the most important security improvements to the Internet ever*

**Steve Crocker**

Internet Pioneer and Chair of the Board of ICANN

“2011 Steve Crocker speaks about DNSSEC Deployment”, Oct 2011

## The Truth

Not default for desktops and many appliances  
NEED to test! real dnssec is not enabled(if  
enabled they are not set to check parent for  
delegate signature, this means an attacker  
can disable dnssec. this is done for  
compatibility reasons.)

Administrator need to learn to manage

Broken chain of trust, my experience at CBTL

## DNSSEC

DNSSEC ensures credibility of DNS information.

DNSSEC protects against data spoofing and corruption.

DNSSEC adds security, while maintaining backwards compatibility.
